

METAL ROOFING

STANDING SEAM

Built with metal panels and concealed fasteners, this roofing system delivers a strong, weather-tight design built to last. Its durability shines even in extreme conditions. Instead of nails or screws, the panels are attached to the roof deck with clamps, eliminating penetrations that could allow moisture in. By keeping fasteners covered, the system helps prevent premature wear or failure.

STONE COATED STEEL

Stone-coated steel roofing is a metal roofing system covered with a layer of stone granules, giving it the look of traditional shingles, tile, or shake while providing the strength of steel. It's lightweight, extremely durable, and resistant to wind, hail, and fire—offering long-lasting protection with a more classic, textured appearance.

R-PANEL

R-Panel roofing is a type of metal roofing made from durable steel panels shaped with deep ridges. It's commonly used for both residential and commercial buildings because it's strong, low-maintenance, and cost-effective. The overlapping panels create a tight, weather-resistant seal, and they can be installed over existing shingles, which helps save time and labor.
